# EXECUTIVE OVERVIEW

## 1.1 INTRODUCTION

Moonwell Finance engaged Halborn to conduct a security audit on their Governance smart contracts beginning on September 18th, 2022 and ending on September 26th, 2022. The security assessment was scoped to the smart contracts provided to the Halborn Team.

## 1.2 AUDIT SUMMARY

The Team at Halborn was provided one week for the engagement and assigned a full-time security engineer to audit the security of the smart contract. The security engineer is a blockchain and smart-contract security expert with advanced penetration testing, smart-contract hacking, and deep knowledge of multiple blockchain protocols.

The purpose of this audit is to:

- Ensure that smart contract functions operate as intended.
- Identify potential security issues with the smart contracts.

In summary, Halborn identified some security risks that were addressed by the Moonwell Finance Team.

## 1.3 TEST APPROACH & METHODOLOGY

Halborn performed a combination of manual and automated security testing to balance efficiency, timeliness, practicality, and accuracy regarding the scope of the smart contract audit. While manual testing is recommended to uncover flaws in logic, process, and implementation; automated testing techniques help enhance coverage of smart contracts and can quickly identify items that do not follow security best practices. The following phases and associated tools were used throughout the term of the audit:

- Research into architecture and purpose.
- Smart Contract manual code review and walkthrough.
- Graphing out functionality and contract logic/connectivity/functions([solgraph](#)).
- Manual Assessment of use and safety for the critical Solidity variables and functions in scope to identify any arithmetic related vulnerability classes.
- Static Analysis of security for scoped contract, and imported functions.([Slither](#))
- Dynamic Analysis ([ganache-cli](#), [brownie](#), [hardhat](#)).

#### RISK METHODOLOGY:

Vulnerabilities or issues observed by Halborn are ranked based on the risk assessment methodology by measuring the **LIKELIHOOD** of a security incident and the **IMPACT** should an incident occur. This framework works for communicating the characteristics and impacts of technology vulnerabilities. The quantitative model ensures repeatable and accurate measurement while enabling users to see the underlying vulnerability characteristics that were used to generate the Risk scores. For every vulnerability, a risk level will be calculated on a scale of 5 to 1 with 5 being the highest likelihood or impact.

#### RISK SCALE - LIKELIHOOD

- 5 - Almost certain an incident will occur.
- 4 - High probability of an incident occurring.
- 3 - Potential of a security incident in the long term.
- 2 - Low probability of an incident occurring.
- 1 - Very unlikely issue will cause an incident.

#### RISK SCALE - IMPACT

- 5 - May cause devastating and unrecoverable impact or loss.
- 4 - May cause a significant level of impact or loss.
- 3 - May cause a partial impact or loss to many.
- 2 - May cause temporary impact or loss.
- 1 - May cause minimal or un-noticeable impact.

The risk level is then calculated using a sum of these two values, creating a value of 10 to 1 with 10 being the highest level of security risk.

CRITICAL	HIGH	MEDIUM	LOW	INFORMATIONAL
----------	------	--------	-----	---------------

10 - CRITICAL

9 - 8 - HIGH

7 - 6 - MEDIUM

5 - 4 - LOW

3 - 1 - VERY LOW AND INFORMATIONAL

# FINDINGS & TECH DETAILS

### 3.1 (HAL-01) MISSING QUORUM CAP COMPARISON CAN BREAK THE GOVERNANCE - HIGH

#### Description:

**GovernorApollo** is implemented with a new floating quorum feature. A floating quorum is calculated as a weighted average between 80% of the old quorum and 20% of the most recent vote(s). The quorum also has upper and lower bounds. In these bounds, there is no comparison implemented. With the following scenario, dynamic quorum system can be broken.

#### SCENARIO:

- Set quorum caps with the timelock.
- There is no comparison between lowerQuorumCap and upperQuorumCap.
- With the timelock, lowerQuorumCap can be bigger than upperQuorumCap.
- During `_calculateNewQuorum` calculation, newQuorum can be directly manipulated with the timelock.

#### Code Location:

[MoonwellApolloGovernor.sol#L523](#)

#### Listing 1: MoonwellApolloGovernor.sol

```
1     function setQuorumCaps(uint newLowerQuorumCap, uint
L newUpperQuorumCap) external {
2         require(msg.sender == address(timelock), "only timelock");
3
4         if (newLowerQuorumCap != lowerQuorumCap) {
5             uint oldLowerQuorumCap = lowerQuorumCap;
6             lowerQuorumCap = newLowerQuorumCap;
7             emit LowerQuorumCapChanged(oldLowerQuorumCap,
L newLowerQuorumCap);
8         }
9     }
```

```
10         if (newUpperQuorumCap != upperQuorumCap) {  
11             uint oldUpperQuorumCap = upperQuorumCap;  
12             upperQuorumCap = newUpperQuorumCap;  
13             emit UpperQuorumCapChanged(oldUpperQuorumCap,  
14         ↪ newUpperQuorumCap);  
15         }  
16     }
```

#### Risk Level:

**Likelihood - 4**

**Impact - 4**

#### Recommendation:

Ensure that lowerQuorumCap is not bigger than upperQuorumCap.

#### Remediation Plan:

**SOLVED:** The Moonwell team solved this issue by implementing the **comparison** between caps.

**Commit ID:** [c7da88a3fe3f0062d8a83ba808b648f1da369fec](#)

## 3.2 (HAL-02) ABIENCODERV2 IS ACTIVATED BY DEFAULT 0.8+ - INFORMATIONAL

### Description:

`ABIEncoderV2` is being stated in a solidity version 0.8+ which is not needed since `ABIEncoderV2` is activated by default 0.8+.

### Code Location:

`MoonwellApolloGovernor.sol#L2`

#### Listing 2: MoonwellApolloGovernor.sol

```
1 pragma solidity 0.8.10;  
2 pragma experimental ABIEncoderV2;  
3  
4 import "../IERC20.sol";
```

### Risk Level:

**Likelihood - 1**

**Impact - 1**

### Recommendation:

Consider removing the `ABIEncoderV2`.

### Remediation Plan:

**SOLVED:** The `Moonwell team` solved this issue by removing `ABIEncoderV2`.

**Commit ID:** `c7da88a3fe3f0062d8a83ba808b648f1da369fec`

### 3.3 (HAL-03) BUMP SOLIDITY VERSION - INFORMATIONAL

#### Description:

During the review the newest version of solidity was released with the [important bug fixes](#) & [Bug](#).

#### Code Location:

[MoonwellApolloGovernor.sol#L2](#)

#### Listing 3: MoonwellApolloGovernor.sol

```
1 pragma solidity 0.8.10;  
2 pragma experimental ABIEncoderV2;  
3  
4 import "../IERC20.sol";
```

#### Risk Level:

**Likelihood - 1**

**Impact - 1**

#### Recommendation:

Move from 0.8.10 to 0.8.17.

#### Remediation Plan:

**SOLVED:** The [Moonwell team](#) solved this issue by updating pragma to 0.8.17.

**Commit ID:** [c7da88a3fe3f0062d8a83ba808b648f1da369fec](#)

### 3.4 (HAL-04) NO NEED TO INITIALIZE QUORUMADJUSTED WITH FALSE - INFORMATIONAL

#### Description:

boolean variable are initialized to a default value of false per [Solidity docs](#). Setting a variable to the default value is unnecessary.

#### Code Location:

[MoonwellApolloGovernor.sol#L278](#)

#### Listing 4: MoonwellApolloGovernor.sol

```
1      Proposal storage newProposal = proposals[proposalCount];
2      newProposal.id = proposalCount;
3      newProposal.proposer = msg.sender;
4      newProposal.eta = 0;
5      newProposal.targets = targets;
6      newProposal.values = values;
7      newProposal.signatures = signatures;
8      newProposal.calldatas = calldatas;
9      newProposal.startTimestamp = startTimestamp;
10     newProposal.endTimestamp = endTimestamp;
11     newProposal.startBlock = 0;
12     newProposal.forVotes = 0;
13     newProposal.againstVotes = 0;
14     newProposal.abstainVotes = 0;
15     newProposal.totalVotes = 0;
16     newProposal.canceled = false;
17     newProposal.executed = false;
18     newProposal.quorum = currentQuorum;
19     newProposal.quorumAdjusted = false;
```

Risk Level:

Likelihood - 1

Impact - 1

Recommendation:

Remove explicit initialization for default values.

Remediation Plan:

**SOLVED:** The Moonwell team solved this issue by removing explicit initialization.

Commit ID: [c7da88a3fe3f0062d8a83ba808b648f1da369fec](#)

### 3.5 (HAL-05) CURRENT QUORUM CAN BE EMITTED DURING THE PROPOSAL CREATION - INFORMATIONAL

#### Description:

Events allow capturing the changed parameters so that off-chain tools/interfaces can register such changes with timelocks that allow users to evaluate them and consider if they would like to engage/exit based on how they perceive the changes as affecting the trustworthiness of the protocol or profitability of the implemented financial services. The alternative of directly querying on-chain contract state for such changes is not considered practical for most users/usages. In the implementation, current quorum is not emitted on the proposal generation.

#### Code Location:

[MoonwellApolloGovernor.sol#L282](#)

#### Listing 5: MoonwellApolloGovernor.sol

```

1      Proposal storage newProposal = proposals[proposalCount];
2      newProposal.id = proposalCount;
3      newProposal.proposer = msg.sender;
4      newProposal.eta = 0;
5      newProposal.targets = targets;
6      newProposal.values = values;
7      newProposal.signatures = signatures;
8      newProposal.calldatas = calldatas;
9      newProposal.startTimestamp = startTimestamp;
10     newProposal.endTimestamp = endTimestamp;
11     newProposal.startBlock = 0;
12     newProposal.forVotes = 0;
13     newProposal.againstVotes = 0;
14     newProposal.abstainVotes = 0;
15     newProposal.totalVotes = 0;
16     newProposal.canceled = false;
17     newProposal.executed = false;
```

```
18         newProposal.quorum = currentQuorum;
19         newProposal.quorumAdjusted = false;
20
21         latestProposalIds[newProposal.proposer] = proposalCount;
22
23         emit ProposalCreated(newProposal.id, msg.sender, targets,
    ↳ values, signatures, calldatas, startTimestamp, endTimestamp,
    ↳ description);
24         return newProposal.id;
```

#### Risk Level:

**Likelihood - 1**

**Impact - 1**

#### Recommendation:

Consider omitting current quorum on the proposal creation.

#### Remediation Plan:

**SOLVED:** The Moonwell team solved this issue by adding current quorum to the event.

Commit ID: [c7da88a3fe3f0062d8a83ba808b648f1da369fec](#)

### 3.6 (HAL-06) USE PREFIX INCREMENT WITH THE UNCHECK CAN SAVE GAS - INFORMATIONAL

#### Description:

The code sections use `i++` which costs more gas than `++i`, especially in a loop. Finally, the initialization of `i = 0` can be skipped, as `0` is the default value.

#### Code Location:

[MoonwellApolloGovernor.sol#L255-L676](#)

#### Listing 6: MoonwellApolloGovernor.sol

```

1      function getQuorum() public view returns (uint) {
2          uint newQuorum = currentQuorum;
3
4          // Start at the high water mark
5          for (uint i = lastQuorumAdjustment + 1; i < proposalCount;
↳ i++) {
6              // Pull state and ignore in flight proposals
7              ProposalState proposalState = state(i);
8              if (proposalState == ProposalState.Pending ||
↳ proposalState == ProposalState.Active) {
9                  continue;
10             }
11
12             // Get the proposal
13             Proposal storage proposal = proposals[i];
14
15             // Only proceed if quorum for this proposal is not yet
↳ taken into account.
16             if (!proposal.quorumAdjusted) {
17                 // If a proposal is canceled, ignore it in quorum
↳ calculations.
18                 if (proposalState == ProposalState.Canceled) {
19                     continue;

```

```
20         }
21
22         // Adjust quorum in accordance with the proposal.
23         newQuorum = _calculateNewQuorum(newQuorum,
    ↪ proposal.totalVotes);
24     }
25 }
26
27     return newQuorum;
28 }
29
```

#### Risk Level:

**Likelihood - 1**

**Impact - 1**

#### Recommendation:

Use ++i instead of i++ to increment the value of an uint variable. Use unchecked where possible, and skip initialization to 0.

#### Remediation Plan:

**SOLVED:** The Moonwell team solved this issue with using prefix increment.

**Commit ID:** [c7da88a3fe3f0062d8a83ba808b648f1da369fec](#)

### 3.7 (HAL-07) SAFEMATH IS ACTIVATED BY DEFAULT AFTER 0.8.X - INFORMATIONAL

#### Description:

Solidity versions  $\geq 0.8.x$  perform checked arithmetic by default, so the SafeMath library is unnecessary in most cases.

#### Code Location:

[MoonwellApolloGovernor.sol#L704-L713](#)

#### Listing 7: MoonwellApolloGovernor.sol

```
1      function add256(uint256 a, uint256 b) internal pure returns (
↳ uint) {
2          uint c = a + b;
3          require(c >= a, "addition overflow");
4          return c;
5      }
6
7      function sub256(uint256 a, uint256 b) internal pure returns (
↳ uint) {
8          require(b <= a, "subtraction underflow");
9          return a - b;
10     }
```

#### Risk Level:

**Likelihood - 1**

**Impact - 1**

#### Recommendation:

It is recommended to delete SafeMath from the contract.

## Remediation Plan:

**SOLVED:** The **Moonwell team** solved this issue with deleting **SafeMath** from the contract.

Commit ID: [c7da88a3fe3f0062d8a83ba808b648f1da369fec](#)

### 3.8 (HAL-08) MISSING NATSPEC DOCUMENTATION ON THE FUNCTIONS – INFORMATIONAL

#### Description:

Some functions are missing @param for some of their parameters. Given that NatSpec is an important part of code documentation, this affects code comprehension, auditability, and usability.

#### Code Location:

[MoonwellApolloGovernor.sol#L523](#)

#### Listing 8: MoonwellApolloGovernor.sol

```
1      function setQuorumCaps(uint newLowerQuorumCap, uint
↳ newUpperQuorumCap) external {
2          require(msg.sender == address(timelock), "only timelock");
3
4          if (newLowerQuorumCap != lowerQuorumCap) {
5              uint oldLowerQuorumCap = lowerQuorumCap;
6              lowerQuorumCap = newLowerQuorumCap;
7              emit LowerQuorumCapChanged(oldLowerQuorumCap,
↳ newLowerQuorumCap);
8          }
9
10         if (newUpperQuorumCap != upperQuorumCap) {
11             uint oldUpperQuorumCap = upperQuorumCap;
12             upperQuorumCap = newUpperQuorumCap;
13             emit UpperQuorumCapChanged(oldUpperQuorumCap,
↳ newUpperQuorumCap);
14         }
15     }
```

Risk Level:

Likelihood - 1

Impact - 1

Recommendation:

Consider adding in full NatSpec comments for all functions to have complete code documentation for future use.

Remediation Plan:

**SOLVED:** The `Moonwell team` solved this issue by adding `natspecs` on the `functions`.

Commit ID: `c7da88a3fe3f0062d8a83ba808b648f1da369fec`

### 3.9 (HAL-09) CHANGING FUNCTION VISIBILITY FROM PUBLIC TO EXTERNAL - INFORMATIONAL

#### Description:

There are the functions declared as public that are never called internally within the contract. It is good practice to mark such functions as external, as this saves gas (Especially in the case where the function takes arguments, since external functions can read arguments directly from call data instead of having to allocate memory).

#### Code Location:

Listing 9: MoonwellApolloGovernor.sol

```

1      function castVote(uint proposalId, uint8 voteValue) public {
2          return _castVote(msg.sender, proposalId, voteValue);
3      }
4
5      function castVoteBySig(uint256 proposalId, uint8 voteValue,
↳ uint8 v, bytes32 r, bytes32 s) public {
6          bytes32 domainSeparator = keccak256(abi.encode(
↳ DOMAIN_TYPEHASH, keccak256(bytes(name)), getChainId(), address(
↳ this)));
7          bytes32 structHash = keccak256(abi.encode(BALLOT_TYPEHASH,
↳ proposalId, voteValue));
8          bytes32 digest = keccak256(abi.encodePacked("\x19\x01",
↳ domainSeparator, structHash));
9          address signatory = ecrecover(digest, v, r, s);
10         require(signatory != address(0), "GovernorApollo::
↳ castVoteBySig: invalid signature");
11         return _castVote(signatory, proposalId, voteValue);
12     }

```

Risk Level:

Likelihood - 1

Impact - 1

Recommendation:

Functions should be marked as an external for gas optimization.

#### Listing 10

```
1 public - everyone can access.  
2  
3 external - Cannot be accessed internally, only externally.  
4  
5 internal - only this contract and contracts derived from it can  
6 ↪ access.  
7  
7 private - can only be accessed from this contract.
```

Remediation Plan:

**SOLVED:** The Moonwell team solved this issue by setting **external** functions.
